

System Novasit BM

Mixed penetration sealing system made of mortar

Fibre-free mixed penetration sealing system made of special mortar. For electrical cables and lines of all types, electrical installation conduits, combustible and non-combustible pipes and further services.

Fire resistance class: maximum EI 120 in accordance with EN 13501-2 as per ETA-22/0051

1. Preliminary remarks / overview

1.1 Target group

The installation instructions are intended solely for personnel trained in fire protection.

1.2 Use of the instructions

Before starting work, read through these installation instructions completely once. Pay particular attention to the following safety instructions.

The authorisation holder assumes no liability for damage caused by failure to comply with these instructions.

Pictorial representations serve as examples only. Installation results may differ in appearance.

Unless stated otherwise, all lengths are specified in mm.

Subject to errors, misprints and changes. All information contained in this brochure reflects the state of the art or, if applicable, the requirements of the pertinent standard at the time of printing (24.09).

All information in this document represents the state of the art at the time of writing or the current version of the standard.

Upon request, flamro will be pleased to provide the relevant legal and technical framework and manufacturer specifications for each individual case.

1.2.1 Safety instructions

Consult the respective safety information for the individual penetration seal components.

Personal protective equipment:

| | |
|---|--|
|  | Wear protective clothing and non-slip shoes. |
|  | Use safety goggles, safety glasses. |
|  | P2 particle filter in case of short-term or low level exposure. Use breathing protection in compliance with international/national standards. |
|  | Use chemically resistant gloves. Recommended materials: butyl rubber, nitrile rubber, fluorinated rubber, PVC. |

Safety instructions for the installation of floor penetration seals

| | |
|---|---|
|  | The area below the floor penetration seal must be cordoned off against entry during penetration seal work (barrier tape and warning sign: warning of possible falling objects, do not enter the area, penetration seal work in floor openings). |
|  | The contractor for the production of floor penetration seals must inform the client in writing (for forwarding to the client or appointed representative) that after the production of the fire penetration seals in floors, these must be secured on site against loads, in particular against being stepped on, by suitable measures (e.g. by fencing or by covering with grating). |

System Novasit BM

1.3 Building elements

Plasterboard walls

Plasterboard walls must have a minimum thickness of ≥ 100 mm.

Plasterboard walls with timber studs must be declared and installed with at least the same number of layers as tested. The distance between the opening and the studs and transoms must be ≥ 100 mm. The gap between seal and stud / timber girt is sealed with an insulation of at least 100 mm, reaction to fire class A1 or A2 according to EN 13501-1.

If one or more studs must be cut to install the seal, horizontal girts must be installed.

The cladding of the aperture edge must consist on all sides of at least two layers of 12.5 mm cement or gypsum-bound building boards with a reaction to fire of class A1 or A2 according to EN 13501-1, corresponding to the respective wall cladding.

Standard plasterboard wall construction is not applicable for construction on the basis of sandwich panels or for plasterboard walls with one-sided cladding (shaft walls).

The supporting structure must have the required fire resistance rating in accordance with EN 13501-2.

Solid walls

Made of masonry, concrete, reinforced concrete or aerated concrete with a density of ≥ 450 kg/m³.

The walls must be classified for the desired fire resistance duration in accordance with EN 13501-2.

Solid floors

Made of concrete, reinforced concrete or aerated concrete with a density of ≥ 550 kg/m³.

The floors must be classified for the desired fire resistance duration in accordance with EN 13501-2.

2. Thicknesses, sizes and spacing

| Dimensions | | | |
|---|------------------------|-----------------|------------------|
| | Plasterboard wall [mm] | Solid wall [mm] | Solid floor [mm] |
| Thickness of building element | ≥ 100 | ≥ 150 | ≥ 150 |
| Thickness of penetration seal | ≥ 100 | ≥ 150 | ≥ 150 |
| Maximum dimensions of the aperture (width × height) | 550 × 600 | 1200 × 2000 | 1200 × 2000 |
| Distance to other penetration seals | ≥ 100 | ≥ 100 | ≥ 100 |
| Distance to other apertures or installations | ≥ 200 | ≥ 200 | ≥ 200 |

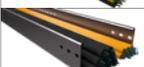

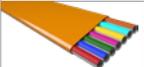

The total allowable cross section of the installations (outer dimensions) is $\leq 60\%$ of the construction aperture.

System Novasit BM

3. Allowed services

For specific fire resistance classes and pipe end configurations depending on measurements and fire protection measures see the respective chapters on design variants starting on page 15.

3.1 Cables / electrical installation conduits / speedpipes

| Service | | Max. diameter [mm] | |
|---|--|---|---|
|  | Cables | ≤ 80 | |
|  | Cable bundles | ≤ 150, cable Ø ≤ 21 | |
|  | Cable trays | ✓ | |
|  | CT Cable Tube | Lengths: 150 mm, 200 mm, 300 mm With cables, cable bundles, single or bundled electrical installation conduits, speedpipes | |
|  | Electrical installation conduits made of plastic | single | ≤ 63 (wall) / ≤ 100 (floor), with or without cables |
| | | bundled | ≤ 100, conduit Ø ≤ 32, with or without cables |
|  | speedpipes | ≤ 50, single Ø ≤ 14 | |

3.2 Combustible pipes

| Standard pipes | | | |
|----------------|--|---------------|--------------------------|
| Pipe material | In accordance with standard | Diameter [mm] | Pipe wall thickness [mm] |
| PVC-U | EN 1329-1, EN 1452-2, EN 1453-1, EN ISO 15493 | ≤ 200.0 | 1.8–14.6 |
| PVC-C | EN 1566-1, EN ISO 15493, EN ISO 15877 | ≤ 160.0 | 1.8–14.6 |
| PE-HD | EN 1519-1, EN 12201-2, EN ISO 15494, EN 12666-1 | ≤ 200.0 | 1.8–18.2 |
| PP | EN 1451-1, EN ISO 15874, EN 15494, DIN 8077 / DIN 8078 | ≤ 160.0 | 1.8–18.2 |
| PP-H | EN 1451-1, EN ISO 15874, EN 15494 | ≤ 200.0 | 1.8–11.4 |
| ABS | EN 1455-1, EN ISO 15493 | ≤ 160.0 | 1.8–14.6 |
| SAN + PVC | EN 1565-1 | ≤ 160.0 | 1.8–14.6 |

| Uponor Uni Pipe MLC | ≤ 110.0 |
| fusiotherm®-Stabiverbund-Rohr | ≤ 110.0 |
| fusiotherm® SDR 11 | ≤ 315.0 |

3.4 Non-combustible pipes

| Pipe material | Outer Ø [mm] | Pipe wall thickness [mm] |
|---|-------------------|--------------------------|
| Copper, steel, stainless steel, cast iron | ≤ 15.0 | ≥ 0.8 |
| | > 15.0 – ≤ 108.0 | ≥ 1.0 – ≥ 2.5 / ≤ 14.2 |
| Steel, stainless steel, cast iron | > 108.0 – ≤ 323.9 | ≥ 2.6 – ≥ 7.5 / ≤ 14.2 |

Pipes made of other metals may be used in the seal if their heat transfer is lower than that of steel or copper with a melting point of ≥ 1049 °C.

3.5 Other services

| Service | Dimensions |
|---|---|
|  HVAC split line combinations | Copper pipe $\varnothing 2 \times 18$ mm + 9 mm PE foam + 1 pipe PVC-U/PVC-C $\varnothing \leq 25.0 \times 1.5$ mm + $\leq 3 \times$ cable $\varnothing \leq 14.0$ mm |
| | Copper pipe $\leq 2 \times \varnothing 22$ mm + 9 mm PE foam + 1 pipe PVC-U $\varnothing \leq 25.0$ + $\leq 2 \times$ cable $\varnothing \leq 21.0$ mm or. $3 \times$ cable $\varnothing \leq 14.0$ mm |
|  Double solar pipes NanoSun ² | ≤ DN 25 |
|  HANSA-FLEX hydraulic hoses | ≤ 55.9 mm |

System Novasit BM

3.6 Initial supports

Penetrating services must be supported at the distances specified in the table below. In wall constructions support is required on both sides. In floor constructions support is required on the upper side of the floor. Essential parts of the supports must be non-combustible.

| First supports | Wall and floor |
|--|----------------|
| Cables, cable bundles, cable support systems | ≤ 500 |
| Electrical installation conduits | ≤ 500 |
| speedpipes for glass fibre cables and micro cables | ≤ 250 |
| Combustible pipes | ≤ 500 |
| Multilayer pipes | ≤ 400 |
| Non-combustible pipes with section insulation made of mineral fibre mats or shells | ≤ 500 |
| Non-combustible pipes with section insulation made of FEF | ≤ 500 |
| HVAC split line combinations | ≤ 700 |
| Double solar pipes NanoSun ² | ≤ 500 |
| HANSA-FLEX wire braided hydraulic hoses | ≤ 500 |
| Cable Tube installations | ≤ 300 |

All specifications in mm.

4. Reduced spacing requirements for services

| | Distance to | Plasterboard wall (thickness 100 mm) | Solid wall (thickness 150 mm) | Solid floor (Thickness 150 mm) |
|--|---|---|--------------------------------------|-----------------------------------|

6. Design

6.1 Fire resistance classes

System Novasit BM meets the requirements of max. class EI 120 in accordance with EN 13501-2.

The fire resistance class of the sealing system is reduced to the fire resistance class of the installed service with the lowest fire resistance rating.

The fire resistance class of the sealing system is reduced to the maximum fire resistance class of the surrounding building element.

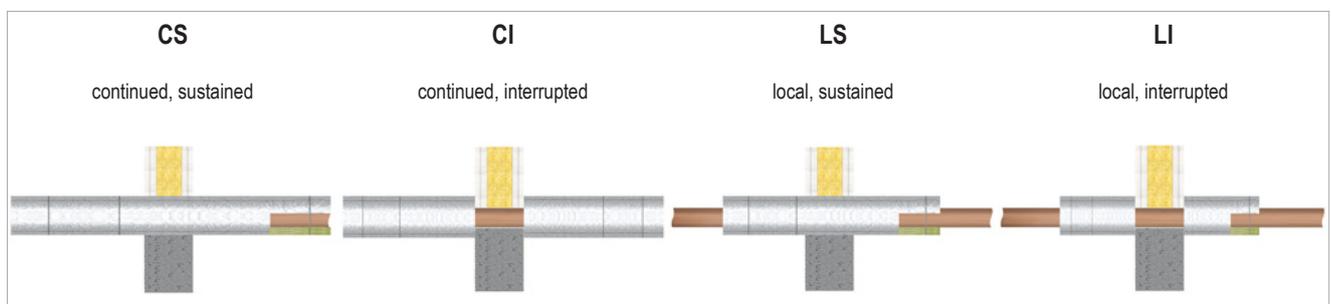

| Building element | Fire resistance class |
|-------------------|-----------------------|
| Plasterboard wall | max. EI 120 |
| Solid wall | max. EI 120 |
| Solid floor | max. EI 120 |

6.3 Pipe insulation configurations

Results for LS insulation are also applicable to CS insulation.

Results for LI insulation are also applicable to CI insulation.

System Novasit BM

7. Design variants

The sealing system may be used to close apertures without installations (reserve penetration for subsequent configurations).

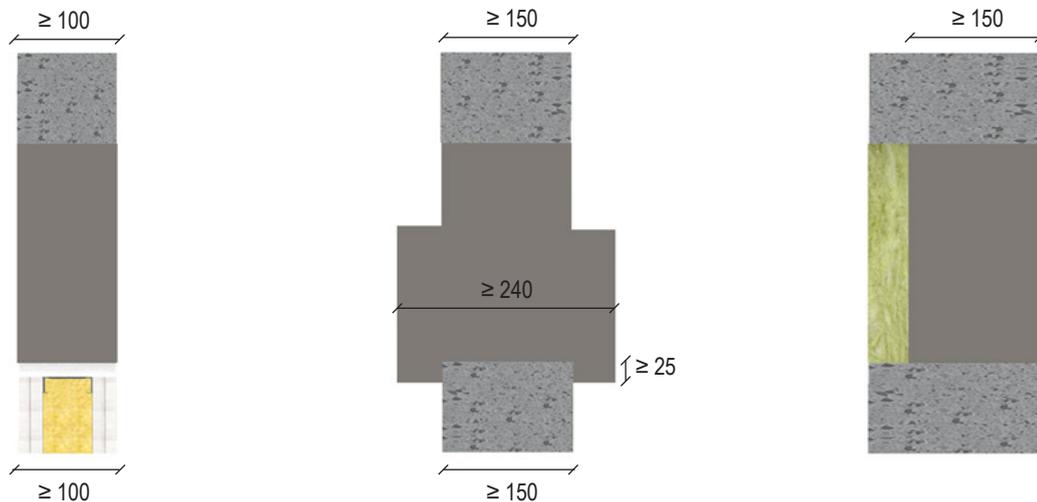

There must be suitable measures in the buildings to secure sealing systems in floors from being stepped on or subjected to loads.

When installing in walls, shuttering may be necessary on one side. When installing in floors, shuttering may be necessary on the lower side.

When installing in floors, seal surfaces $> 500 \times 500$ mm without services or cable trays must be provided with an appropriate friction-locked steel reinforcement.

The structural and fire protection properties of the lintel or the floor above the aperture must ensure that the sealing system is not subjected to additional vertical load (except its own weight).

Design variants for walls

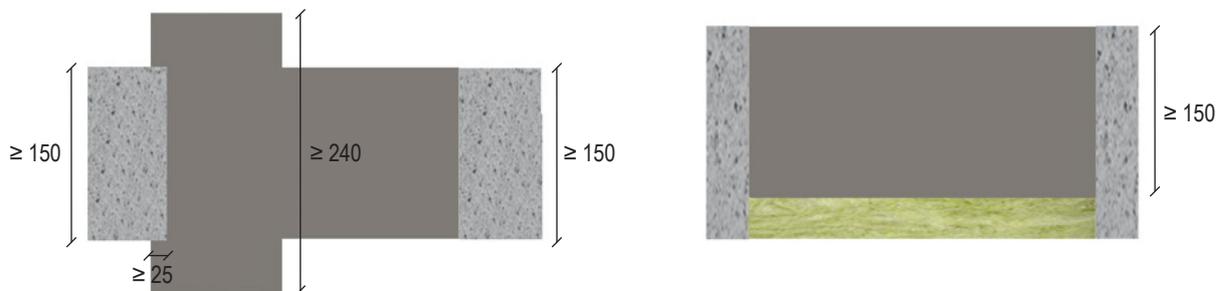

Design with NOVASIT BM fire protection mortar.

A mineral fibre mat (non-combustible, melting point > 1000 °C) may be used for permanent shuttering.

All specifications in mm.

Design variants for floors

Design with NOVASIT BM fire protection mortar.

A mineral fibre mat (non-combustible, melting point > 1000 °C) may be used for permanent shuttering.

All specifications in mm.

System Novasit BM

8. Fire protection measures

8.1 Cables / cable bundles / cable support systems

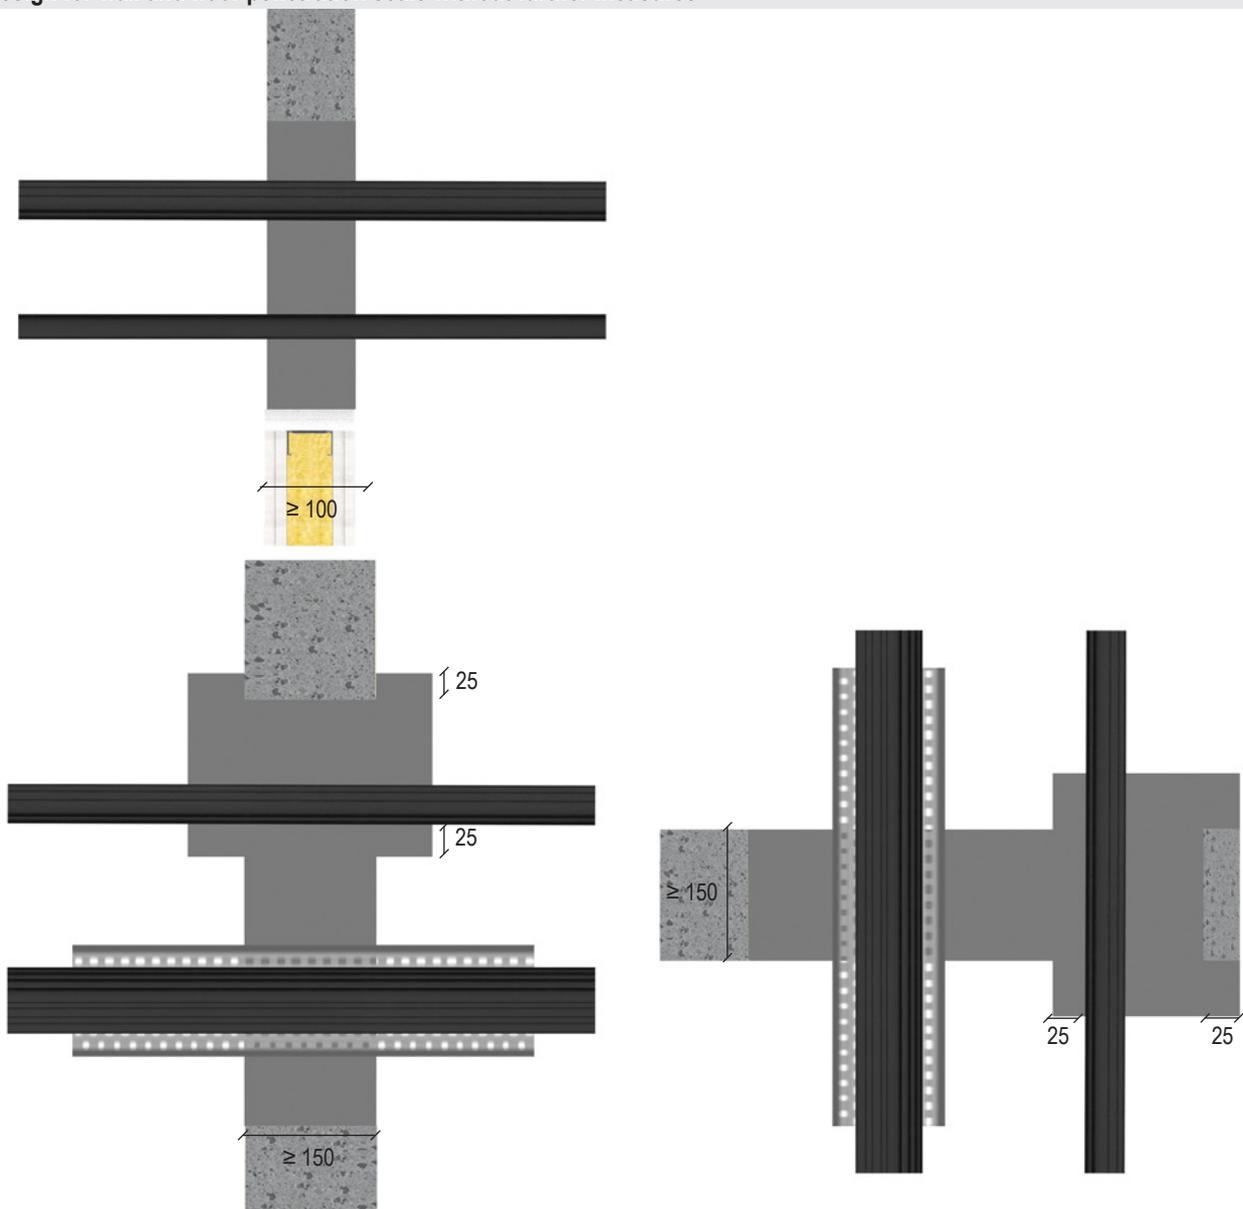

Cables and cable bundles may be installed with or without cable trays.

Cable bundles may be installed unopened in the seal. It is not necessary to fill the interstices of the bundles consist of parallel-running cables that are tightly packed, tied, stitched or welded together.

The supporting structures for cable trays must be designed in such a way that the penetration seal will not be subjected to additional mechanical stress in case of fire.

In case of cable support structures made of sheet steel or hollow aluminium profiles, the spars must be drilled and filled with the ablative filler FLAMMOTECT-A in the penetration area (necessary measures must be coordinated on site).

Design for wall and floor penetration seals without further measures

For building element and seal thicknesses see page 5. For design variants see page 14.

All specifications in mm.

System Novasit BM

| Services | Dimensions [mm] | Sealing thickness [mm] | Fire resistance class | | |

System Novasit BM

8.1.1 Design with fire protection wrap NBR-plus

The fire protection wrap NBR-plus is coated on one side and equipped with a protective film. The film must be removed before applying the wrap with the coated side facing inwards.

The fire protection wrap must be secured with winding wire against falling out.

Design for wall and floor penetration seals with fire protection wrap

For building element and seal thicknesses see page 5. For design variants see page 14.

All specifications in mm.

System Novasit BM

| Services | Outer diameter [mm] | Fire protection wrap NBR-plus | | | Fire resistance class | | |
|---------------|---------------------|-------------------------------|----------------------|--|-----------------------|------------|---------------|
| | | Number of wraps [n] | Number of layers [n] | Overlap [mm] | Plasterboard wall | Solid wall | Solid floor |
| Cables | ≤ 50 | 2 × 125 | 2 | – | EI 90 / E 120 | – | – |

| – | | EI 120 | EI 120 | | | | |
| Cable bundles | ≤ 150 | 2 × 125 | 1 | – | EI 120 | EI 120 | EI 120 |

System Novasit BM

8.2 Electrical installation conduits, single or bundled

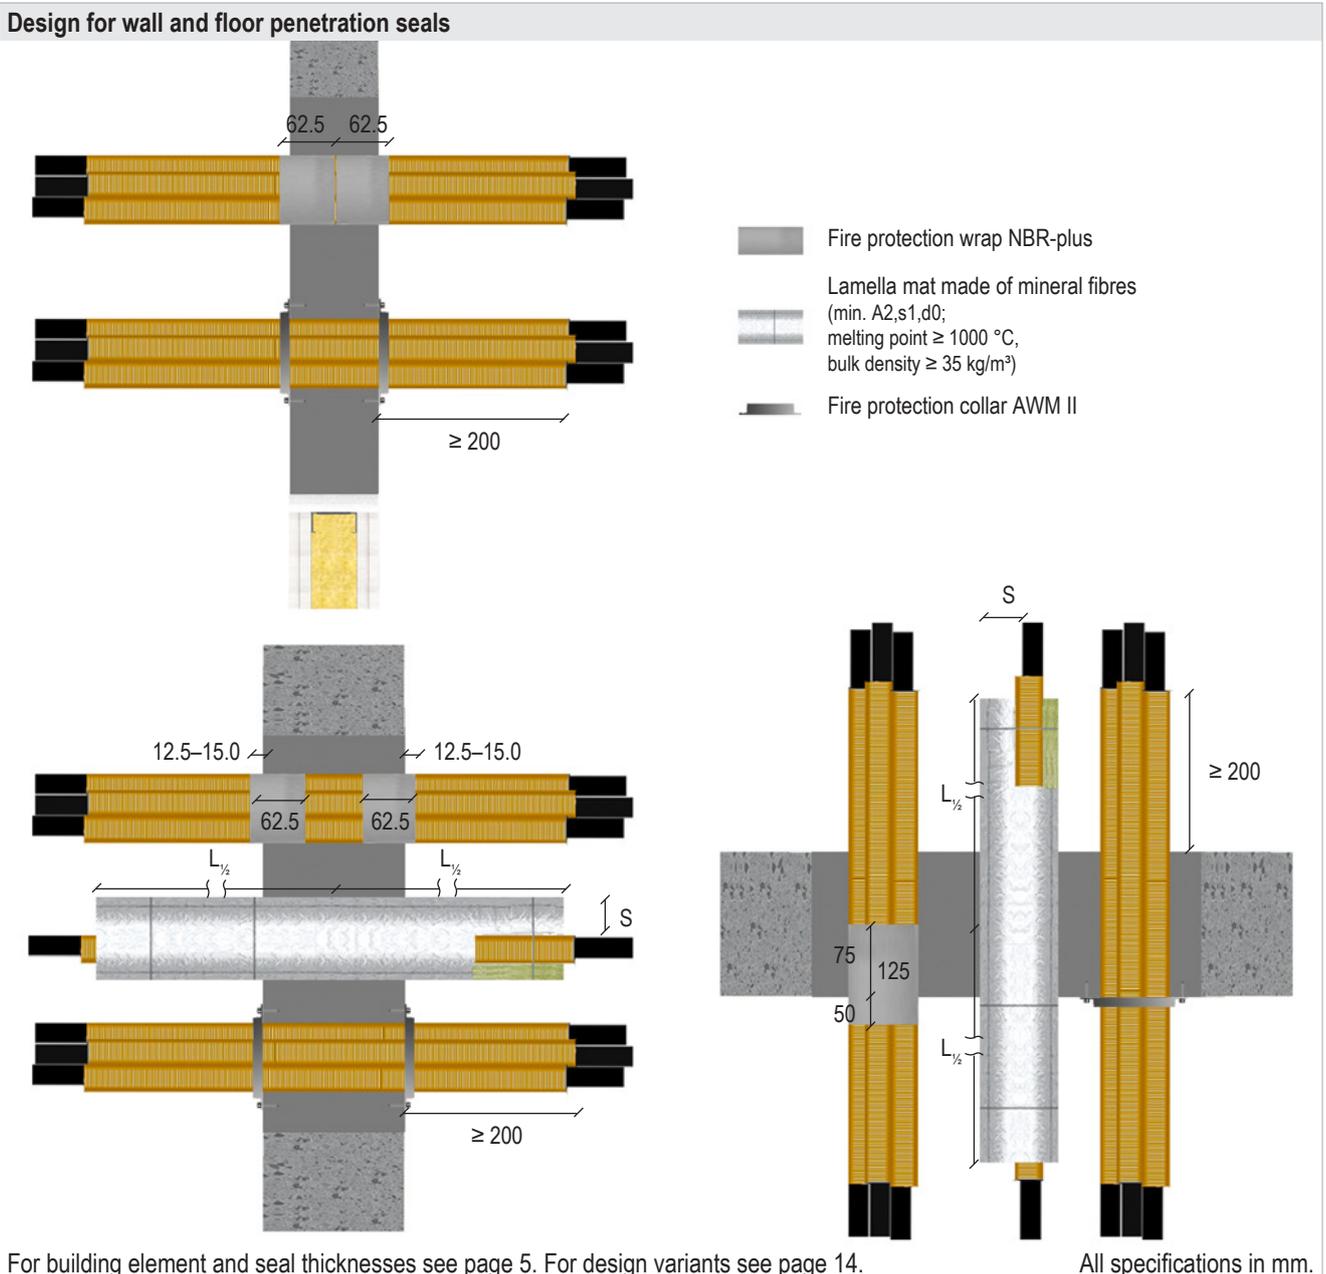

Installed conduits must be sealed on each side at a depth of at least 10 mm.

The fire protection wrap NBR-plus is coated on one side and equipped with a protective film. The film must be removed before applying the wrap with the coated side facing inwards. For easier installation the wrap can be secured against falling out with duct tape or winding wire.

Section insulation made of mineral fibre mats or shells must be fastened with tension bands or wire.

When using fire protection collars, always choose the smallest size fitting the single conduits or bundles. The inner diameter of the collar may not exceed the outer diameter of the conduit or bundle by more than 15 mm.

Use appropriate fasteners for the collars (dowels / steel screws / threaded rods M6 for inner Ø 63–75 mm, M8 for inner Ø 90–125 mm).

System Novasit BM

* With additional protective insulation made of mineral fibre mat ($L_1 \geq 500$ mm x $D_1 \geq 30$ mm).

System Novasit BM

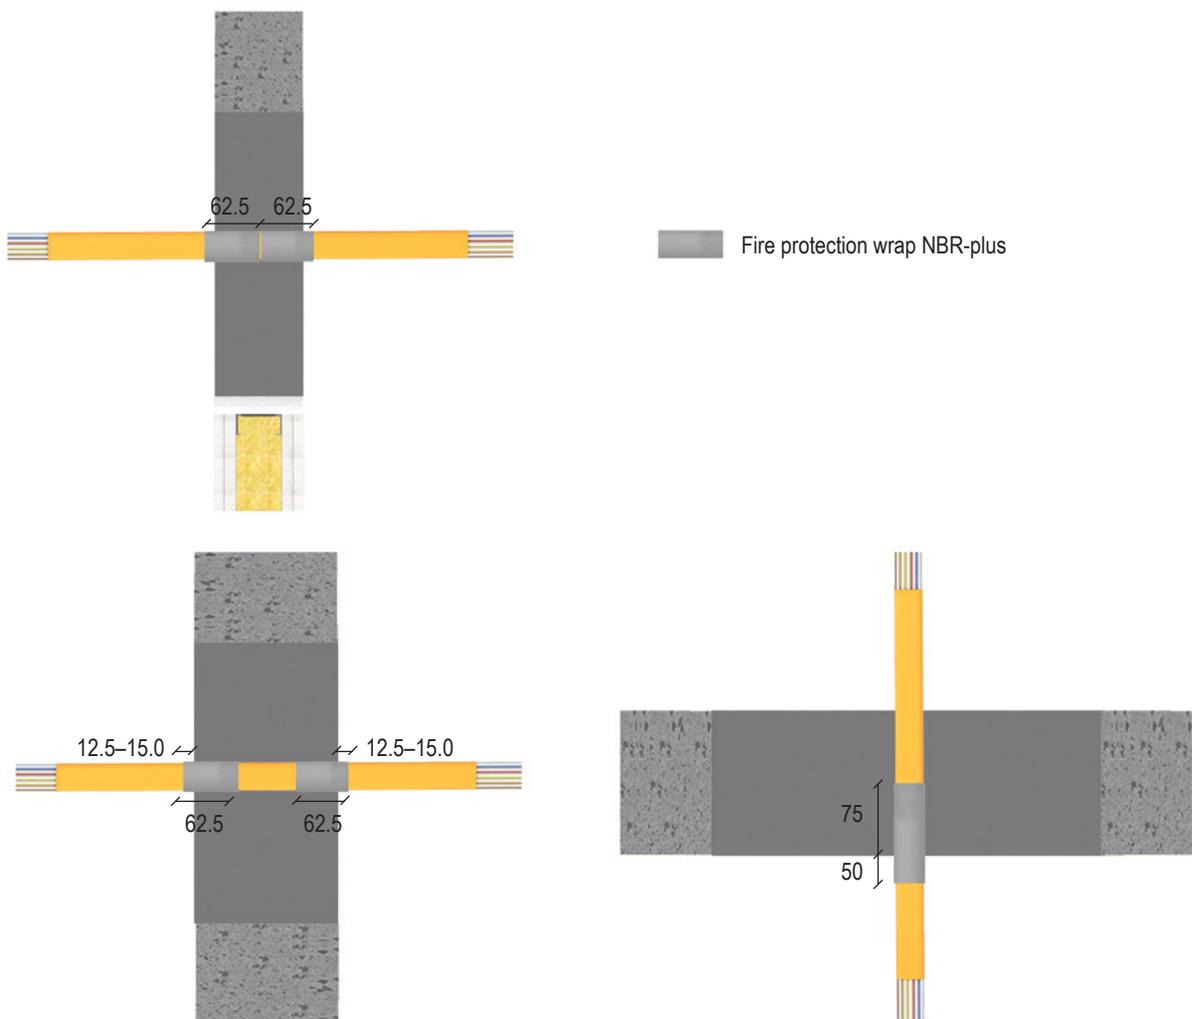

8.3 speedpipes

speedpipes must be installed with the fire protection wrap NBR-plus.

The fire protection wrap NBR-plus is coated on one side and equipped with a protective film. The film must be removed before applying the wrap with the coated side facing inwards.

For easier installation the wrap can be secured against falling out with duct tape or winding wire.

Design for wall and floor penetration seals

For building element and seal thicknesses see page 5. For design variants see page 14.

System Novasit BM

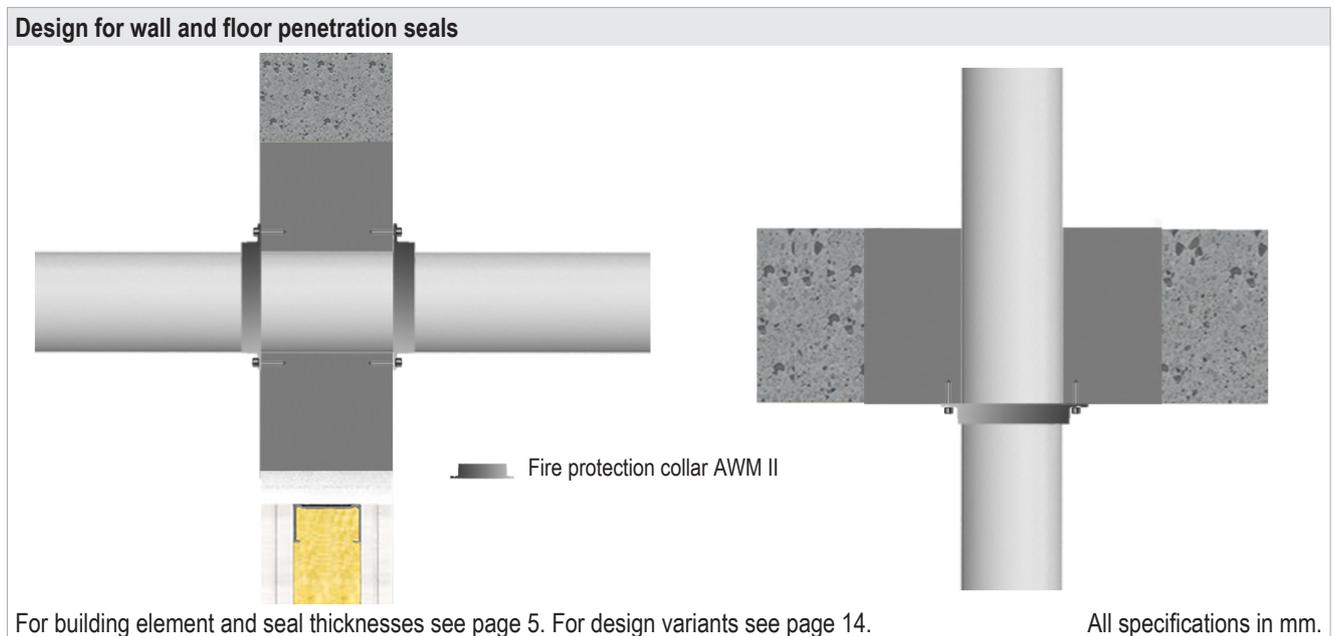

8.4 Combustible pipes

8.4.1 Design with fire protection collar AWM II

In walls, fire protection collars AWM II must be installed on both sides. In floors, one collar must be installed on the lower side. Pipes must always be installed perpendicularly to the surface of the building element, unless other installation possibilities are explicitly mentioned.

The penetration sealing may only be used on pneumatic conveyors, compressed air lines etc. if the pipeline system is switched off in the event of a fire.

Optionally a soundproofing tube ≤ 5 mm may be installed.

System Novasit BM

8.4.2 Design with fire protection wrap KSL-W

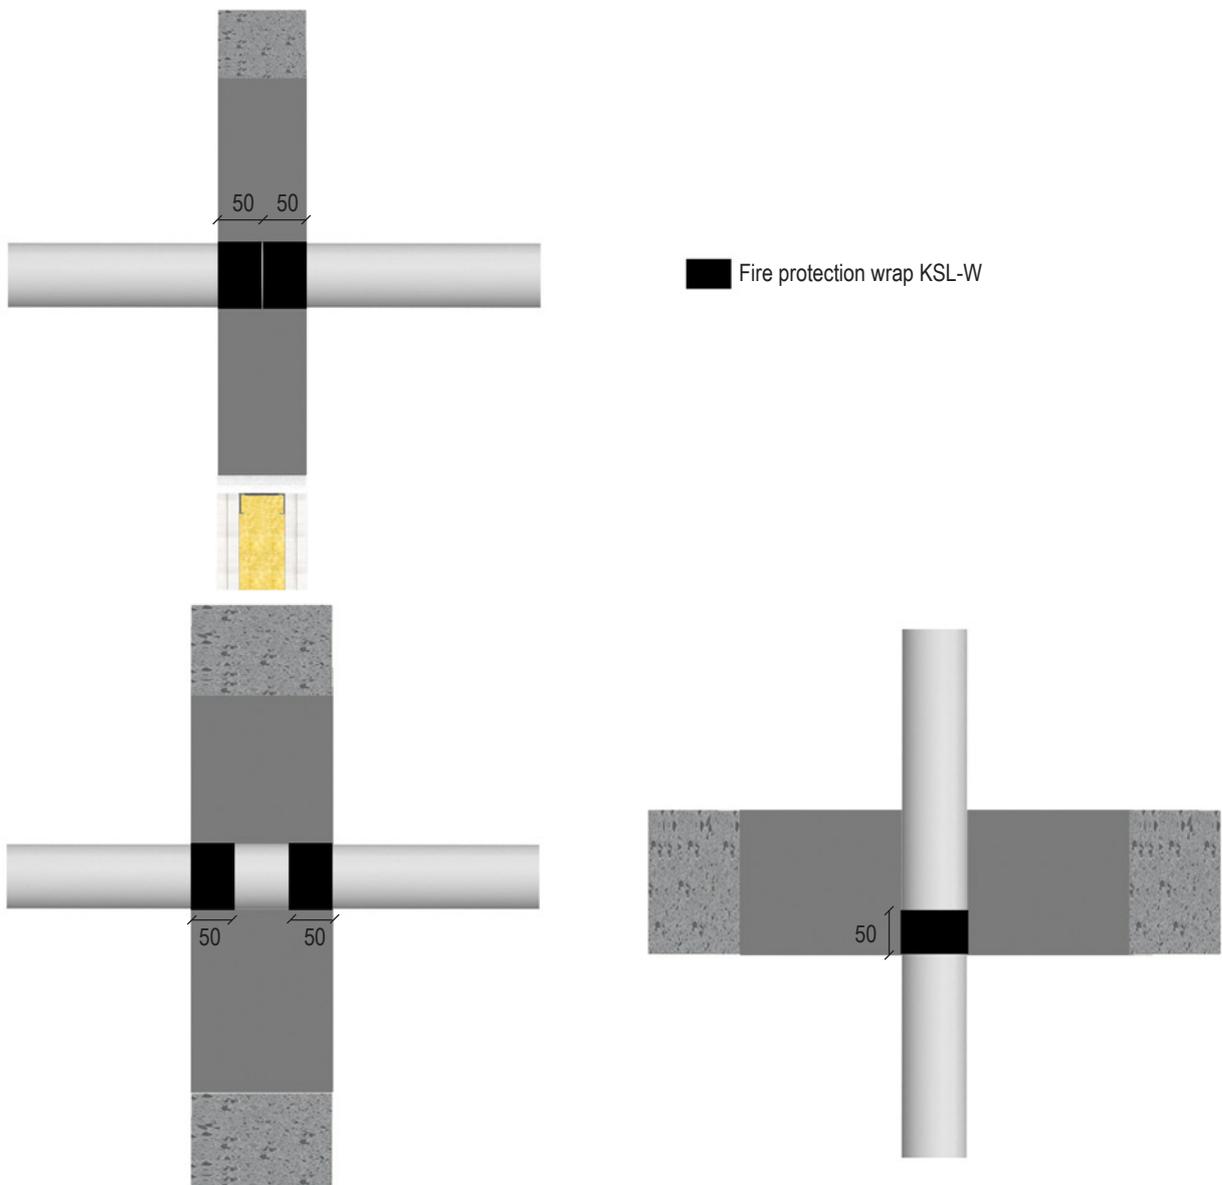

In walls, fire protection wraps KSL-W (wrap width 2×50 mm) must be installed on both sides. In floors, only one wrap must be installed on the lower side.

Pipes must always be installed perpendicularly to the surface of the building element.

The penetration sealing may only be used on pneumatic conveyors, compressed air lines etc. if the pipeline system is switched off in the event of a fire.

Optionally a soundproofing tube ≤ 5 mm may be installed.

Design for wall and floor penetration seals

For building element and seal thicknesses see page 5. For design variants see page 14.

All specifications in mm.

8.6 Non-combustible pipes

8.6.1 Section insulation with lamella mat Klimarock or mineral fibre shells Conlit 150U

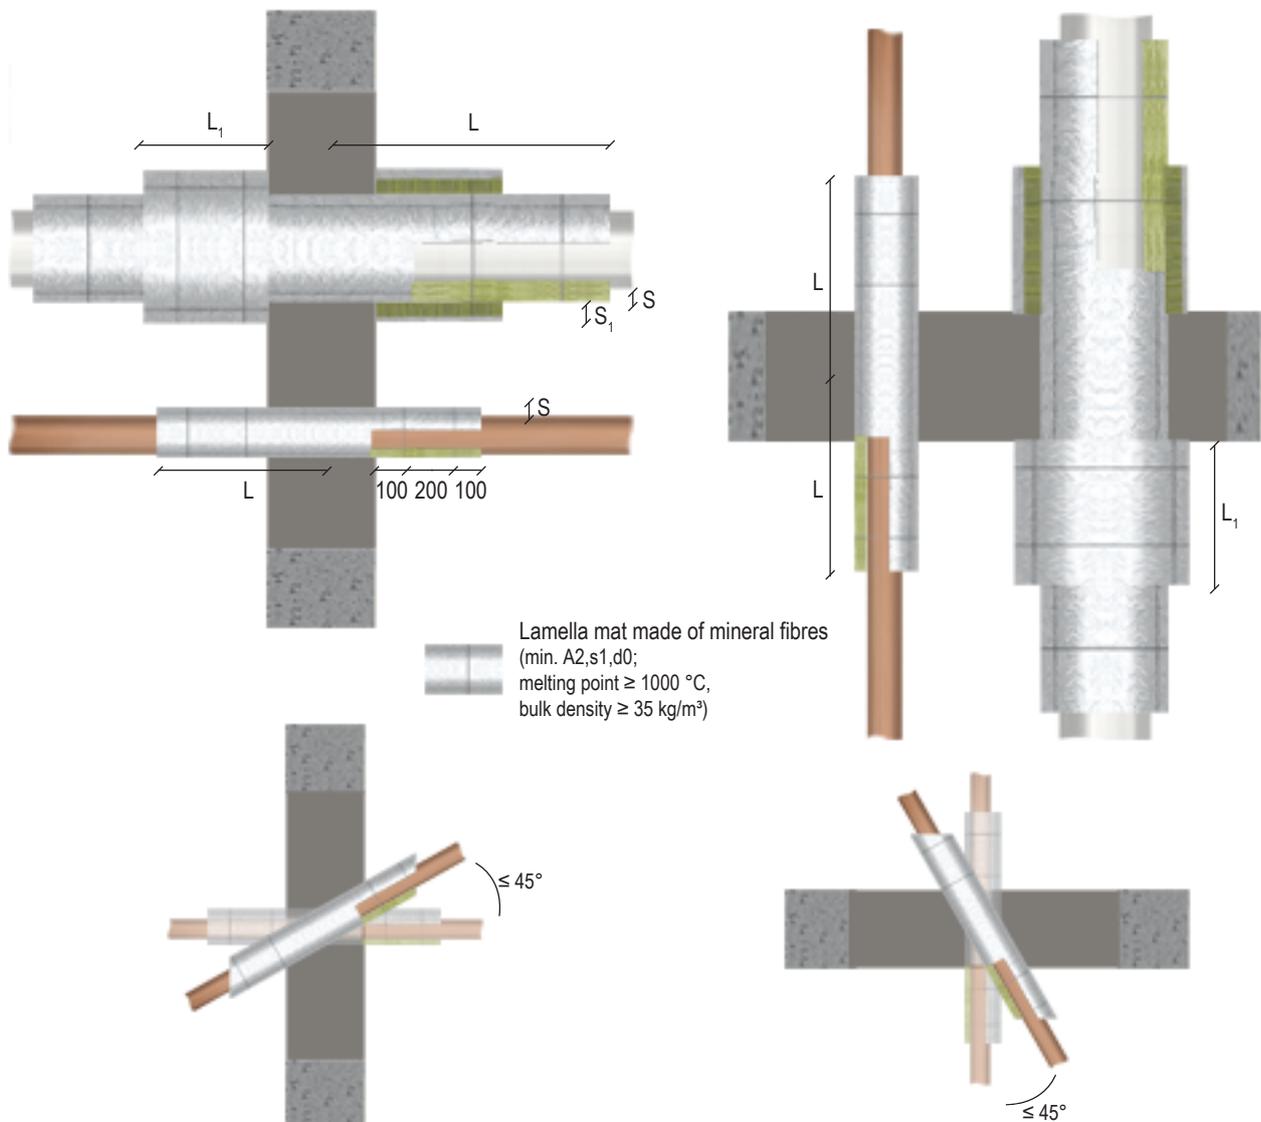

The section insulation must be fastened to the pipes using tension bands or wire (with a spacing of 100 mm or ≤ 200 mm).

When installing in floors, appropriate measures must be applied to secure the section insulation against falling out.

Pipes may be installed at 45° – 90° angles to the surface of the building element.

Depending on pipe wall thickness and the outer diameter of the pipe, an additional protective insulation made of mineral fibre mats may be necessary.

Design for wall and floor penetration seals

For building element and seal thicknesses see page 5. For design variants see page 14.

All specifications in mm.

System Novasit BM

8.10 Cable Tube CT

Depending on the installed services, Cable Tubes with lengths of 150, 200 and 300 mm may be used.

Cables, cable bundles and electrical installation conduits may be installed directly adjacent to each other and to the inner Cable Tube wall.

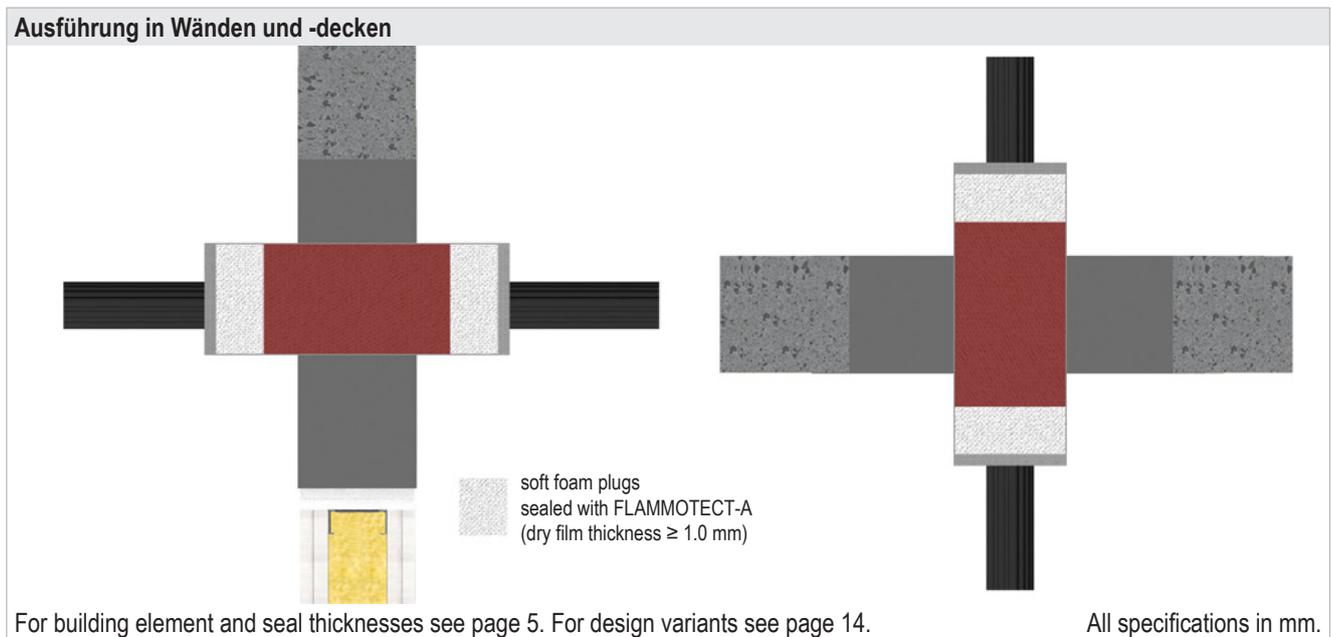

The Cable Tube may be used to seal openings without installations (blank seals).

For detailed installation steps, please consult the Cable Tube CT installation instructions.

For subsequent installations, the sealed soft foam plugs must be removed from the Cable Tube.

The remaining openings between the services and the Cable Tube as well as between the services themselves must be sealed completely with the 40 mm soft foam plugs. Afterwards the plugs must be sealed with the ablative filler FLAMMOTECT-A.

In floors with a thickness of ≥ 200 mm, two 150 mm Cable Tubes can be combined (using duct tape) to a 300 mm Cable Tube.

System Novasit BM

9. Installation steps

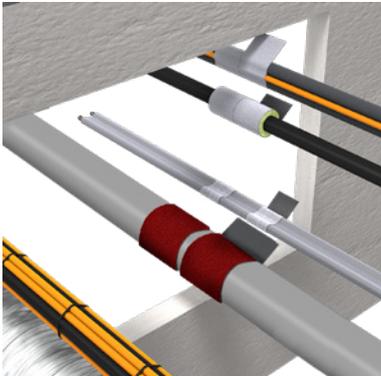

1. If necessary, cover the floor on both sides with protective sheets, clean the aperture edge and wet absorbing surfaces of the aperture with water. Prepare NOVASIT BM fire protection mortar according to the instructions on the packaging.

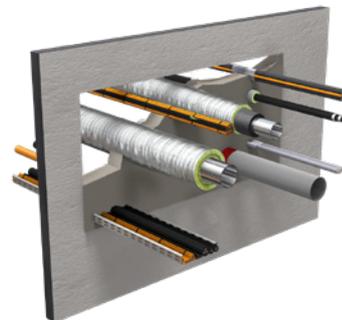

2. When additionally installing non-combustible pipes, apply sectional/protective insulation, when installing HANSA-FLEX hydraulic hoses, apply protective insulation as necessary.

3. When additionally installing NanoSun², HVAC split line combinations or HANSA-FLEX hydraulic hoses, apply the fire protection wrap NBR-plus, when installing combustible pipes, apply the fire protection wrap KSL-W as necessary.

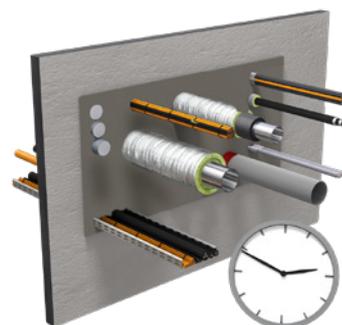

4. Apply the mortar in such a way that it tightly and firmly connects to the building element (sealing thickness ≥ 15 cm). All interstices and cavities must be filled completely.

5. Insert Cable Tube CT with additional services into the mortar, observing the necessary distances. Fill remaining openings completely. Seal the soft foam plugs of the cable tube with FLAMMOTECT-A.

6. After hardening, smooth the surfaces with the trowel and fully rework any shrinkage cracks. The same applies to any areas revealed after removing the shuttering.

System Novasit BM

7. If required, label the penetration seal. Fill out the label neatly and attach it firmly next to the penetration seal.

8. After the mortar residues have dried, remove them from cables, walls and floors. Clean surfaces. Remove the protective sheets and ensure their proper disposal.

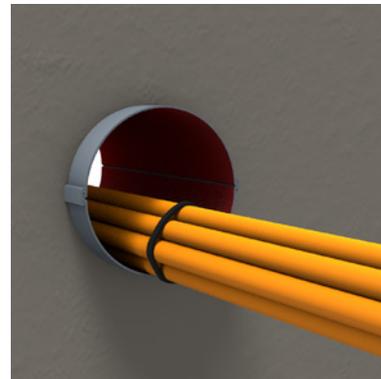

9.1 Subsequent installations with Cable Tube CT

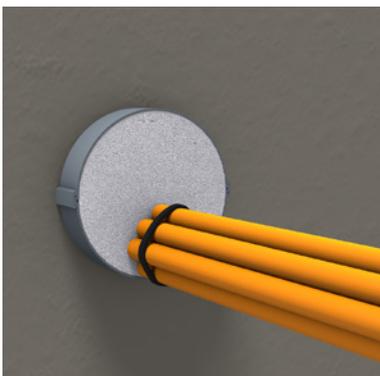

1. Remove the plugs on both sides.

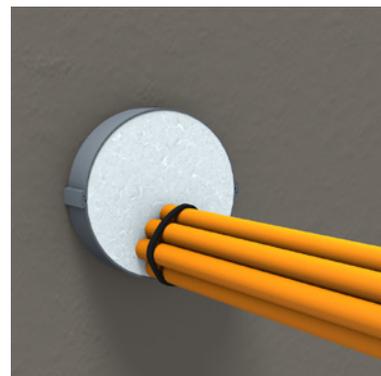

2. Install services in accordance with their respective approval.

3. Adjust the plugs to the services and insert them.

4. Seal plugs with FLAMMOTECT-A (dry film thickness ≥ 1 mm).

When subsequently installing electrical installation conduits without cables, the conduit openings must be filled with mineral wool and sealed with FLAMMOTECT-A.
